The HIGH ENERGY PHYSICS INDEX Keywords 1979

The HIGH ENERGY PHYSICS INDEX Keywords 1979

The terms in this keyword list are used by the DESY documentation service for the indexing of papers on high-energy physics, quantum field theory and accelerator technology.

1. Purpose of Keyword Assignment

Our keywords serve the following purposes:

they allow the establishment of a subject index for the biweekly periodical HIGH ENERGY PHYSICS INDEX,

they make possible mechanized information retrieval and SDI (Selective Dissemination of Information) service at DESY and other high-energy physics centers.

The total keywords assigned to a paper may also be of some use as a sort of abstract.

2. Form of Keyword Assignment

Keywords may be used singly or coupled by comma and blank (examples: FIELD THEORY (single) and FIELD THEORY, NONABELIAN (coupled)). While the first term is generally a regular keyword, the second term may be a keyword or a non-keyword. Regular keywords are shown in this list ordered by subject (page III) and ordered alphabetically (page 1)

Non-keywords which are frequently used are standardized; they are contained in the alphabetical list.

3. Two-Particle Combination

Most of the combinations of any two particles (but not all) in the list are single regular keywords. The particle coming first in the following table should mostly come first in the combination.

(example: PHOTON NEUTRINO is a keyword, but NEUTRINO PHOTON is not a keyword. Combinations of this type may occur in expressions like PHOTON NEUTRINO, ELASTIC SCATTERING)

4. Reaction Equations

Reactions of two particles or decay modes are given as in the following examples:

```
ANTI-P P --> KØ K- PI+
P P --> P ANYTHING
DELTA(1236)Ø --> P PI-
ANTI-P P --> DELTA(1236)Ø(P PI-) PI+ PI-   (+)
```

Particles on the left-hand side are arranged in the order of beam and target, particles on the right-hand side are arranged in the order of falling masses, in case of same masses in the order positive charge - negative charge.

5. Other Particle Combinations

Three-particle combinations (non-keywords) succeeding keywords like VERTEX FUNCTION or COUPLING CONSTANT or INTERFERENCE are listed in the order of rising masses (example: COUPLING CONSTANT, MESON NUCLEON NUCLEON). Final or intermediate states are also given if they are of importance; here the particels are listed in parentheses in the order of falling masses (examples: FINAL STATE, (NUCLEON 2PI); MASS SPECTRUM, (PI+ PI- PIØ)).

6. Resonances

Meson and baryon resonances are generally named as in the Particle Data Group Tables; charge states are indicated only for the rho(765) and the Delta(1236).

7. Depth of Indexing

Papers on peripheral topics will usually have fewer keywords per paper than papers on high-energy physics. Examples of peripheral topics are quantum mechanics, statistical mechanics, gravitation, astrophysics, and nuclear physics with energy above 100 MeV/nucleon.

8. Alphabetical Keyword List

There are three kinds of entries in the alphabetical list:

regular keywords (boldface and blank space in Column 1)

standardized non-keywords ("*" in Column 1); these terms will generally occur as companions to regular keywords. There are also non-keywords which have not been standardized; they are not contained in this keyword list

terms which are <u>not</u> used ("-" in Column 1).

Comments or rules of use are given in parentheses. "Restricted use" means that a keyword is used only in cases where it is of central importance in the paper considered.

Entries are ordered in the IBM sorting sequence:
blank.(+*);-/,<>:'A...Z 0...9

+) The decay products of the DELTA(1236) are given in parentheses (cf. the previous equation).

KEYWORDS BY SUBJECT

This list contains only the regular keywords. Large-case headings and terms in parentheses are not keywords. For standardized non-keywords the alphabetical list should be consulted.
